This filter based on:  
<https://electronics.stackexchange.com/questions/177575/capacitor-selection-for-filtering-of-low-level-signal>  
 - Series resistance less than 10% of 350Ω sensor impedance  
 - Differential filter  $F_c = 4.8\text{kHz}$   
 - CM filter  $F_c = 24\text{kHz}$

It may need to be adjusted to suit a wider variety of load cells. Also, we might need better caps that don't have voltage derating

Designed to prevent ADC overvoltage. The diode will cap at  $AVDD + V_f$ , which is worst case 450mV. The resistor limits the ADC to 4mA, which shouldn't cause damage.

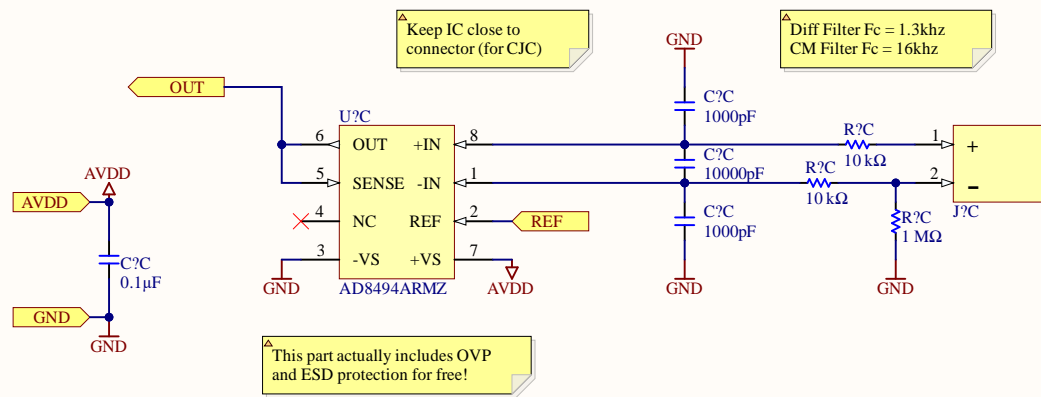

These TVS diodes prevent transients above 12V from getting to the amp or power rail. However, they'll only survive high current for a short time.

This filter based on:

Squib Drivers

Two Chips (MC33797) for 8 total channels  
Pin 2 is Lo and Pin 1 is High on all connectors  
  
R Limit Calc:  $R_{match} = 2\Omega$ , wire is around 2-5ohm depending on length.  
Recomended current is around 1 A  
 $R_{Set} = 10k$  sets limit to 1.4A

# Level Shifters

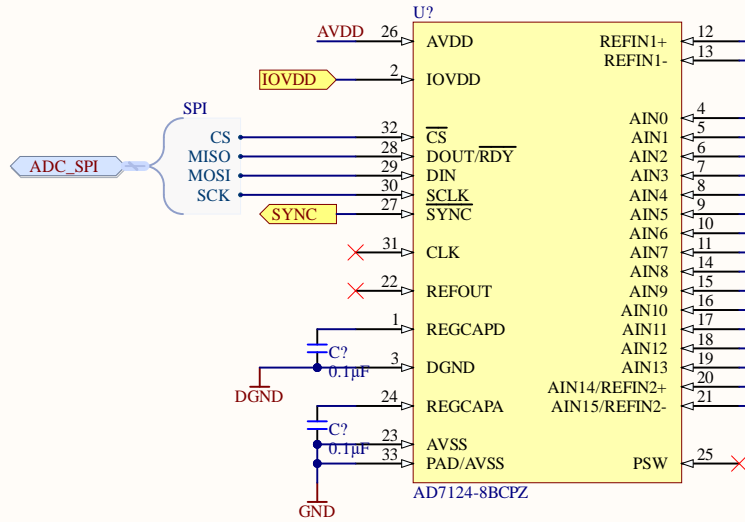

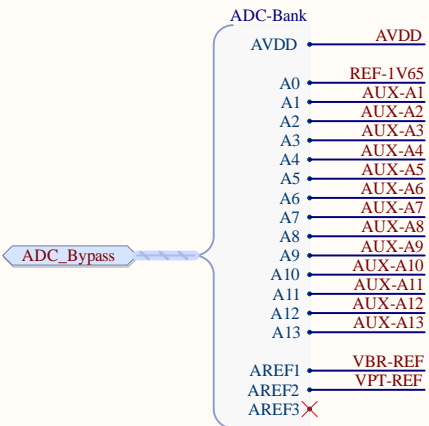

The Squib Drivers operates using 5V logic, the MCU (SAMD51) uses 3.3V so the SPI interface between them needs to be converted

REVIEWED ON	

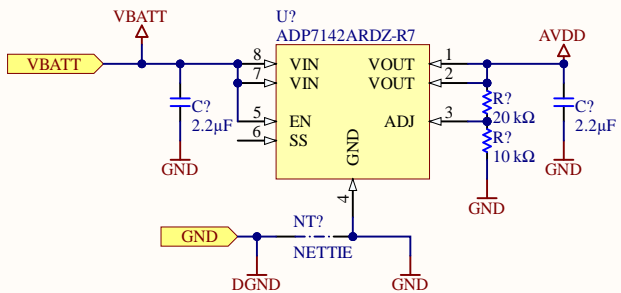

Bridge excitation voltage is 10V, and each load cell draws 35mA max

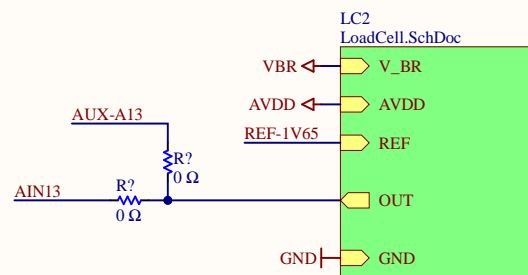

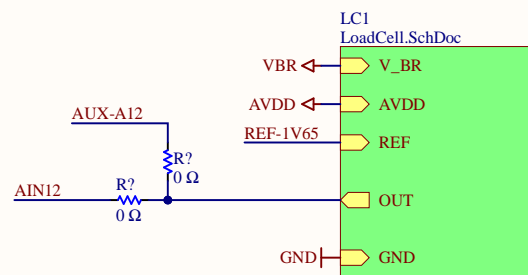

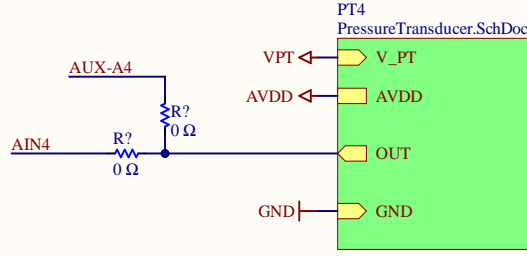

Pressure transducer supply voltage. Unclear if PTs have amps or not? Unclear how much power they draw. Consider changing to an ADP7142 to simplify BOM

IOVDD is 3.3v, powered from top sheet  
AVDD is unipolar, 3.6V from LDO

Mid-Rail reference voltage. The instrumentation amps need this to reference their outputs off of. It needs to be buffered, or the draw from connected devices will skew it.

# Radio Module

TODO

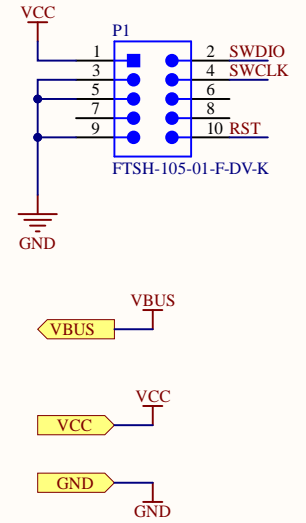

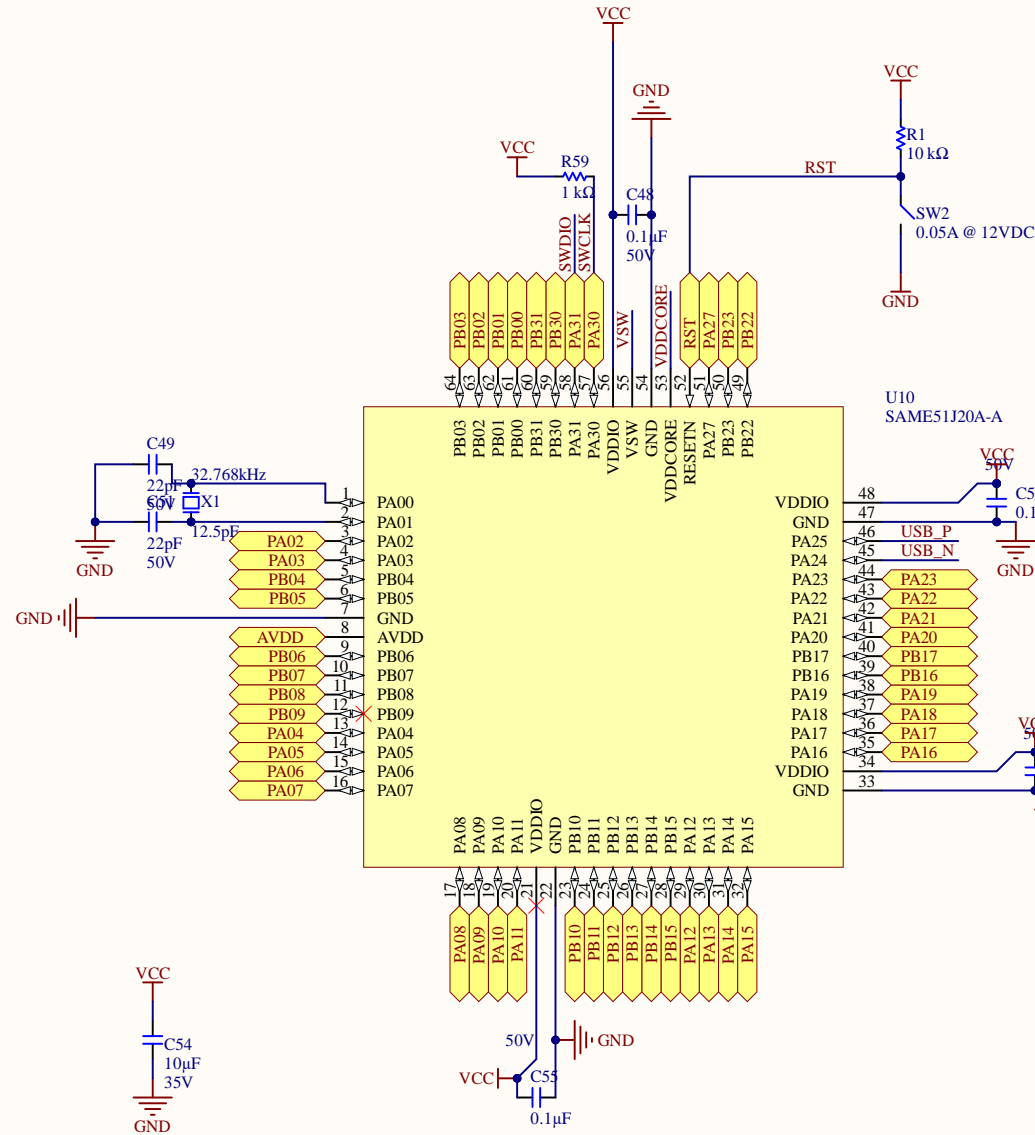

Swap Out with DRF Module

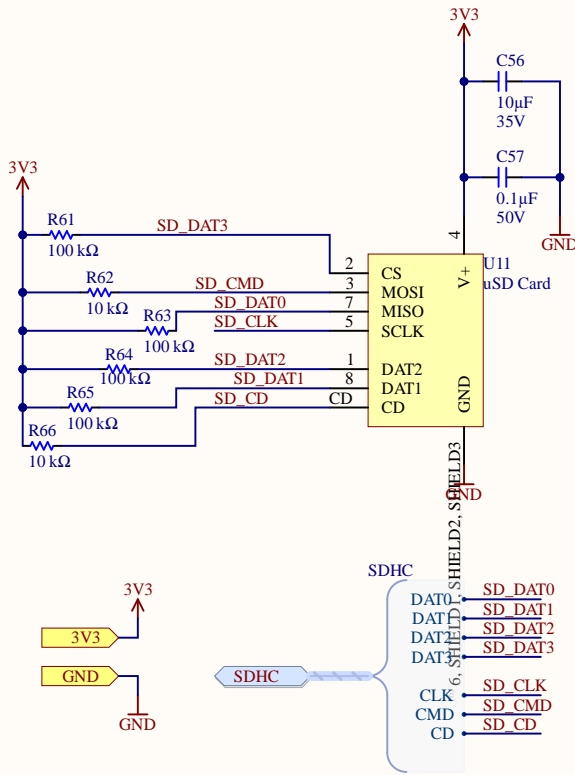

Radio for wireless communiacions  
Dorji DRF1268T being used  
Mainly on Tims Recomendation

(G)FSK/4(G)FSK/LoRa Modulation  
433Mhz transceiver  
Max.22dBm output power  
-147dBm sensitivity  
Standard SPI interface  
Low RX current: 5.7 mA  
Automatic RF sense and CAD monitor  
Data Rate: <300 kbps  
Standby current: <1uA  
Supply voltage: 3.3V
